

CareerPocket AI

Buyer's Guide

Thank you for purchasing CareerPocket AI.

This guide covers everything you need to get started.

What You Have

CareerPocket AI is a personal job search tool that runs entirely in your browser. There is nothing to install. Your data stays on your computer — it is never sent to any server except directly to your AI provider when you use an AI feature.

CareerPocket AI supports both cloud AI providers (such as OpenAI) and local AI models running on your own machine. If you use a local model, your data never leaves your computer and you pay nothing for AI usage. See the Requirements section below for details on both options.

What CareerPocket AI does:

- Review your uploaded resume, give you suggestions and polish your resume to help you build a strong master resume profile
- Captures and track job listings from any job board with one click (bookmarklet beta)
- Scores each job against multiple criteria including your career aspirations, your fit based on the JD requirements, and your profile
- Generates cover letters and ATS-optimised tailored resumes grounded in your own resume language and style
- Tracks your full application pipeline (status, follow-ups, readiness)
- Gives you a career advisor chat that knows your background and pipeline, allowing you to discuss career and job opportunities

Requirements

Browser	Google Chrome or Microsoft Edge (required)
AI option A — Cloud	API key from OpenAI, Anthropic Claude, Google Gemini, or any OpenAI-compatible provider (including Custom endpoints) · ~USD 1–3/month typical
AI option B — Local	A local model running an OpenAI-compatible interface (e.g. Ollama, LM Studio) · AI cost is zero once set up
Backup storage	A Dropbox, OneDrive, or Google Drive folder (strongly recommended so your data has automatic backup in place)

On local AI: we recommend a model of 14B parameters or above. Your machine needs sufficient RAM and ideally a GPU to run it at a useful speed — a 14B model typically requires 16 GB RAM or more. If you are unsure whether your machine is capable, see the Additional Services section at the end of this guide.

Safari and Firefox are not properly supported yet. The data backup folder feature relies on a browser API that these browsers do not implement, and safari clears after periods of inactivity. Regular manual backup is needed and will affect user experience in this product.

Chrome or Edge is the official browser supported right now.

Getting Started (5 minutes)

Step 1 — Open the app

Go to <https://careerpocket.trusted-aide.com> in Chrome or Edge.

Step 2 — Enter your license key

Your key was included with your purchase confirmation. It will be in one of two formats depending on how you purchased:

- One-time purchase key: EXEC-CC-XXXX-XXXX-XXXX-XXXX-TT
- Subscription key: a UUID like a1b2c3d4-e5f6-7890-abcd-ef1234567890

Paste either format into the activation field and click "Activate CareerPocket AI".

Step 3 — Fill up personal information under Settings

This is where you tell CareerPocket about yourself, including personal information that would be included in the resume, as well as your career objectives like target roles, target industry and salary expectations etc. that you are looking for.

Note that these data resides only on your local machine, and possibly backed up only to your local cloud if you choose cloud folders as your backup file. You are not sending this over to any random cloud provider, so your personal data stays with you on your computer.

You can also set a Default Tagline (e.g. "Project Manager | Delivers your Project On-time and On-Budget Always") which appears under your name on all resume exports.

You can also choose a Tagline mode for tailored resumes:

-  Locked — every export uses your default tagline exactly as written.
-  AI-customised — when generating a tailored resume, the AI generates a concise role-specific tagline grounded in your actual experience (your default tagline is used only as a reference, not copied verbatim). The generated tagline appears in an editable field in the document modal so you can review or adjust it before exporting.

The master resume export always uses your default tagline regardless of mode.

Step 4 — Connect your AI provider

Using cloud-based public AI - Eg. OpenAI:

- Go to <https://platform.openai.com> to sign up, go to API Keys, and create a new key.
- Add a small credit (USD 5 is enough to start).
- Paste the key into CareerPocket AI when prompted during setup.
- **Note** - Anthropic Claude and Google Gemini are also supported — change the AI Base URL and model name in Settings. See the Setup Guide for step-by-step instructions for each provider.

Using a local model:

- Start your local inference server (e.g. Ollama: ollama serve)
- In CareerPocket AI enter your local base URL (e.g. <http://localhost:11434/v1>) and the model name.
- If your local server is configured with an API key, enter it in the API-Key field. If you set up your server without authentication (default for Ollama/LM Studio), enter any placeholder value (e.g. sk-local).

Step 5 — Select a backup folder

When prompted, click Select Backup Folder and choose a folder inside your local machine.

We recommend using your personal Dropbox, OneDrive, or Google Drive as these have robust backup mechanisms in place. This is how your data can travel with you if you switch computers.

CareerPocket backs up silently your resume, jobs, and applications data into this selected backup folder after every change. If you leave it on local machine, you can choose to explicitly backup your data regularly as well.

Step 6 — Upload your resume

Go to the Resume tab. Upload your existing resume as a PDF or .DOC document — the AI extracts your experience into a structured master profile. Review the extracted content and edit anything that needs adjusting.

Step 7 - AI Review of your resume (Optional)

On the Resume tab, click AI Review. The AI reads your full resume and flags weak areas, missing metrics, and improvement opportunities. Click Discuss in Career Chat to talk through any finding — the chat has your resume and the review in context.

Step 8 - Career Chat (Chat)

Ask anything: positioning strategy, interview prep, offer negotiation, sector advice. The chat always has your full resume and active pipeline in context. Chats are not saved automatically — click  Save Chat if you want to keep a session.

Once you have a strong master resume in place, that's it. You're ready to start capturing and scoring jobs.

Don't have a resume to upload? We offer partners who can do a resume writing service to get you started. See Additional Services at the end of this guide.

Key Workflows & Features

Capturing a job (bookmarklet — Beta features)

Install the bookmarklet from the Settings → Job Capture section — drag the bookmarklet link to your browser's bookmark bar. Then on any job listing page — LinkedIn, Indeed, company careers page — click the bookmarklet. The job appears in your Jobs queue automatically, ready to score.

The bookmarklet is currently in Beta — it may time out on some pages especially if you are not using a strong enough local machine to power your local AI.

You can always add jobs manually from the Jobs tab. This allows you to capture all the Job Details manually, including company, title, detailed JD, recruiter, URL for job posting etc.

If your bookmark bar is not visible in Chrome or Edge: press Ctrl+Shift+B (Windows/Linux) or Cmd+Shift+B (Mac) to show it, or go to Settings → Appearance → Show bookmarks bar.

Scoring a job

Open a job in your job queue and click Score Job. The AI reads the job description against your master resume and returns a fit score with a breakdown by dimension, flagged gaps, and a suggested positioning angle. Based on the score, it provides a guide whether you want to still pursue the job or not to waste time on this application, since each application costs you precious time.

The Scoring AI also shares with you some key gaps it perceives and also gives you some angles you can position yourself if you do decide to pursue this job. Should you have any questions that you want to clarify based on this score, or if you want to explore other way to position yourself, you also can trigger a discussion/disagreement with AI Career Chat.

Career Chat will remember the score given to you, the JD and your master profile, and then use those information to provide further advice to you, much like a human career coach would as well.

Generating a cover letter or tailored resume

After reviewing the score for a particular job under Jobs Tab, should you decide to proceed, click “Track” to move it into Applications Tab. From here, click 📄 Cover Letter or 📄 Tailored Resume. A positioning dialogue appears first — you can optionally describe how you want to angle the letter or resume for this role. This is used to emphasise the right parts of your background, not to fabricate anything.

The AI generates the document using your master resume content, grounded in the actual job description. Exported documents use a clean, professional format consistent across all users — independent of how your original uploaded resume looked.

After AI generated the cover letter or resume, you are given a window which you can make direct edits, and also comes with the following options:

- ✨ **Polish** — refines the language and impact of your current text (especially after edits) without changing its content or structure. Uses the job description and any existing cover letter as context for alignment.
- 🔄 **Regenerate** — discards the current version and generates a fresh one from scratch (the positioning dialogue reappears). Especially if you switch AI engine, or even with the same AI engine, AI will sometime give you slightly different versions.
- **Save edits** — saves any manual edits you have made to the text.
- **PDF / Word** — exports the document in your chosen format but formatted professionally. For resumes, output are also ATS-optimised. The export reads whatever is currently in the text area, so your edits are included.

Unsaved edits: if you close the modal or reopen it without clicking Save edits first, you will be warned and given the option to cancel.

Cover letter to tailored resume alignment: if you generate a cover letter first, then generate the tailored resume, the resume will automatically align with the positioning, proof points, and angle used in the cover letter. They will tell a consistent story.

Combined export for single-document applications

Some application portals (such as LinkedIn Easy Apply) accept only one uploaded document. Click the  CL+Resume tile on any application card to open both your cover letter and tailored resume in a single document which can also be edited. Edit if needed, then export as PDF or Word. The cover letter appears first, followed by your resume with full professional header.

Job Tracking

After you have cover letter and/or resume available, you can proceed to use them directly for job application.

One of the key capabilities of CareerPocket is to track all your applications in your personal vault, so you can assess them anytime you need and also use AI to help improve it.

When you update status from New to Applied, application date will be defaulted to today's date, which you could change. As the job application progress along various stages, you can also update the status, so you have a kanban view of all the jobs you have applied over time.

Each application has a Notes field in its detail view. This allows you to capture any insights gained for a particular job along the way. Eg. If you were selected by HR for a screening interview, and the HR gave you some tips for next interview, you can record them here so you can remember them

when the next interview comes. You can also record the HR's name or any other information relevant for this particular job. Notes save automatically as you type — no Save button needed.

This job tracking feature is especially powerful, because if you apply for dozens of jobs and customized each application with different tailored cover letter and resume, it helps you remember exactly what was written also for the job, so if the interview comes, usually weeks or months later, you can easily recall what the JD, cover letter and resume submitted looks like, and also any notes taken along the way. This give you a huge edge preparing for the interview.

Moving to a New Computer

You can use CareerPocket AI on a new computer without losing any data — your resume, saved chats, jobs, and applications all can travel with you automatically.

1. On the new computer, open <https://careerpocket.trusted-aide.com> in Chrome or Edge.
2. When prompted, click Select Backup Folder and choose the same Dropbox/OneDrive/Google Drive folder you selected during setup.
 - a. If you did not choose the cloud storage as your backup folder, then you will need to manually point to the folder that contains your backup files, which was created using "Export Manual Backup" feature from your old computer.
 - b. We recommend you to do a manual export backup regularly if you do not select a cloud storage for your backup folder.
3. CareerPocket AI reads your configuration and latest backup — your license key, AI key, resume, jobs, and applications are all restored automatically. Nothing to re-enter.

Browser Permissions

When you use CareerPocket AI, Chrome or Edge will ask for two permissions. Both are required for the product to work correctly.

"careerpocket.trusted-aide.com wants to access other apps and services on this device"

This appears when you use the bookmarklet for the first time. Click Allow.

This permission is for the BroadcastChannel API — a browser feature that allows two tabs in the same browser to pass messages to each other. When you click the bookmarklet on a job listing page, it sends the job title, company, and description across to your CareerPocket AI tab. That is the only thing this permission enables.

It does not give CareerPocket AI access to any application installed on your computer, your files, your email, your contacts, or anything outside the browser. The communication is browser-tab to browser-tab only, and only within the same browser session.

"careerpocket.trusted-aide.com wants to access files on your device" (folder picker)

This appears during setup when you select a backup folder. Click Allow and select a folder inside your Dropbox, OneDrive, or Google Drive.

This permission allows the app to read and write backup files inside the specific folder you choose — and only that folder. It does not give the app access to any other part of your file system. Your resume, jobs, and application data are saved here so they survive browser clears and travel with you to new computers.

Summary: what CareerPocket AI can and cannot access

✓ Can access	The backup folder you explicitly select
✓ Can access	Your AI provider (OpenAI or local model) — to run AI features
✓ Can access	Tab-to-tab messages in the same browser (bookmarklet relay only)
✗ Cannot access	Any other folder or file on your computer
✗ Cannot access	Your email, contacts, calendar, or installed applications
✗ Cannot access	Any server other than your AI provider
✗ Cannot access	Other websites or browser tabs you have open

Your Data & Privacy

- Your resume, jobs, and applications are stored in your browser's local database and backed up to the cloud folder you select.
- Your AI provider key is stored in your browser and your backup folder only. It is sent directly to your chosen AI provider (OpenAI, Claude, Gemini, or local) when you use an AI feature — never to any other server.
- If you use a local AI model, no data leaves your machine at all during AI operations.
- CareerPocket AI has no user accounts and no central database. Nobody else have access to your data.

Additional Services

Resume writing

CareerPocket AI works best when you have an existing resume to upload as a starting point. If your resume is outdated, incomplete, or you are starting from scratch, through our partners, we can offer a professional resume writing service to get you a working document to upload. Email us at support@trusted-aide.com to enquire.

Local AI setup

Running a local AI model gives you complete data privacy and zero ongoing AI cost. Setting it up involves installing a local inference server, choosing and downloading a suitable model, and configuring CareerPocket AI to connect to it.

We offer a one-time guided setup session for USD 100. We will assess your hardware first to confirm it can run a suitable model at a useful speed before you commit.

Email support@trusted-aide.com with "Local AI Setup" in the subject line.

Support

Email: support@trusted-aide.com

If something is not working as expected, include your browser version and a brief description of the issue.

For AI errors (invalid key, quota exceeded, slow responses), the error message in the app usually explains what to do.
